

# Depression

## **Covid-19**

[School closures and parents' mental health](#) Study of parents in England reveals mothers suffered from loneliness, depression and problems sleeping.

[Neurology and neuropsychiatry of COVID-19](#) A new meta-analysis of 147 studies has identified a range of effects of COVID-19. The symptoms with the highest prevalence were anosmia, weakness, and fatigue. 23% of people experienced depression, and 15.9% anxiety.

## **Studies**

[Study shows adaptive brain response to stress, and its absence in people with depression](#) A new study identifies a novel biomarker indicating resilience to chronic stress. This biomarker is largely absent in people suffering from major depressive disorder, and this absence is further associated with pessimism in daily life.

[Patients' experience of ketamine treatment for depression: the 'Ketamine and me' project](#) Review of a recent qualitative study exploring patients' experience and response to ketamine treatment for depression.

Life after injury: physical, psychological and social impact This blog discusses a qualitative study which finds that experiencing an injury from a traumatic event like a serious road traffic accident, can impact on physical, psychological and social wellbeing.
